

## How to Choose the Best Internet Speed for Your Needs

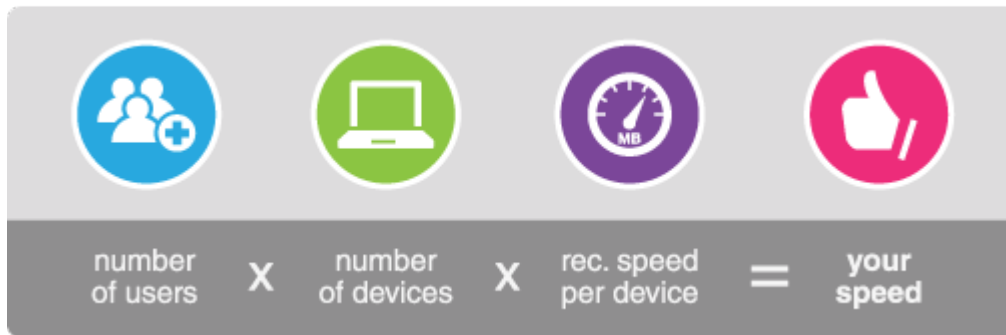

Whether you spend your time on the Internet sending e-mail, downloading music, playing online games or streaming videos, we have a variety of plans to ensure you're connected to the Web with an Internet plan that meets both your speed and budget needs. Here are a few basic pointers to help you choose the speed that's right for you:

- Please note that speeds recommended here are **per device**. Laptops, tablets, smartphones, video devices, gaming systems and more, each count as one device. You'll have to choose a higher speed in order to power all of these devices at once without issues.
- Sharing Internet with other users will also require additional bandwidth (higher speed).

- Calculate the number of users times the number of devices times the recommended speed per device, to get your recommended speed

#### Recommended Speed Per Device

Surf online	2 Mbps
Check email	2 Mbps
Upload photos	2 Mbps
Stream video	3 Mbps
Netflix	6 Mbps
Hulu	6 Mbps

- Once you calculate your speed needs, choose the speed package just above your lowest needs. For example, you calculate that you need 45 Mbps; choose the 50 Mbps package.
- Very important: Installing a wireless router can slow down your Internet speed. In order to accurately test your BSBB speed, plug your Ethernet cable directly into your computer, then proceed with a speed test.
